* Like the HTML Elements have attributes the same way React has props

* we cannot add css in custom Components they always have to go into HTML Elements

* import React from 'react'
  import ReactDOM from 'react-dom'

```
Function  card (props) {      ← object
    return (
        <div>
        <h1>{props. name} </h1>
        <img  src ={props. img} />
        <p> { props. email } </p>
        <p> { props. phone } </p>
        </div>
    );
```

```
const root = ReactDOM.create Root (document. get Element By ID("root")),
  root. render (
      <React. Strict Mode>
          <Card  name = "Mohit"   img =" https://abc"
          email = "mohit@gmail.com"  phone =" 8975228950" />
      <React. Strict Mode>
  )
```

here we cannot write
ClassNane as it
will see it as a
custom Property
(and will be shown
under props Object)

* react developer tools

* key = should be unique
